

30 minute Interface Usability Testing Guide:

A quick reference guide for use in workplace

Team members:

David McKillen

Carol Mackey

Scope:

The goal of this suggested project is to create a conclusive, concise "How-to" guide to interface usability testing. This guide can include three main sections:

- 1) Overview:** A concise overview of the different subsections in a step 1 through step X process.
- 2) How-to Steps:** Folders containing a concise "how-to" summary description of each step.
- 3) Examples:** Sub folders of example files to demo how one might practically apply knowledge.

Deliverables:

The project can be divided into 2 main parts:

Part I: Guide content elicitation:

The entire guide content will be assembled based on the three main sections outlined above. David will be the primary team member working on Part I with assistance from Carol

Part II: Website:

Creation of a static website for posting of the material in a semi-permanent location:

For the purposes of this class the website can be posted at www.mckillen.net. Should Dr. Kasper find any further use for this guide, all site content will be provided in a compact disk. Carol will be the primary team member working on Part II with assistance from David.

Timeline:

The estimated timeline will extend until the end of the Spring semester.
