

Step 15: Detailed User Interface Design.

Purpose of this step:

The purpose of this step is to have a complete user interface design that optimizes user performance and satisfaction.

Overview:

In this step we define and document the design based on the Conceptual Model Design and Screen design standards established in previous chapters. Designers can follow the product style guide to adhere to Conceptual Model Design and Screen Design Standards. However with larger projects multiple designers are dispersed across sub sets of the projects. When designers are less experienced there may be the necessity to have a head interface designer create a detailed user interface design spec. to assist in design.

Practical application of these principles to your site:

- 1) **Complete the identification of all pathways between windows, dialog and message boxes**
- 2) **Complete the design of all action controls**
- 3) **Complete the design of content**
- 4) **Complete the design of all interactions with input devices**

Examples: See examples of this step in the “Examples” folder.
